UI/UX DESIGNER · PRACTICE ASSESSMENT

Send to M-Pesa: Flow Redesign

Time: 90 minutes **Tools:** Figma + paper **Platform:** Android, 360×800

The brief

Co-op Bank's data shows that **38% of customers who start a "Send to M-Pesa" transfer in the app never finish it.** Support also gets many complaints:

> *"I didn't know there was a fee until after I sent."*
>
> *"I sent money to the wrong number and couldn't reverse it."*
>
> *"The app froze after I entered my PIN. I didn't know if the money went or not, so I sent again and was charged twice."*

Your task: Redesign the **Send to M-Pesa** flow in the Co-op mobile app to reduce drop-off and errors.

Users

Mama Wanjiru, 52

Murang'a · Dairy farmer · Sacco member

- Low-end Android phone, patchy 3G
- Sends money to her children at university
- Prefers Swahili and is nervous about making mistakes

Brian, 27

Nairobi · Works in marketing

- Uses the app every day
- Sends money to friends and his landlord's M-Pesa
- Wants it fast and hates extra steps

Requirements

Your flow must include:

- ☐ Choosing a recipient: a new number, a phone contact, or a recent or saved recipient
- ☐ Entering the amount and choosing which account to send from
- ☐ Showing the **fee and total before the customer confirms**
- ☐ Showing the **recipient's registered M-Pesa name** before sending
- ☐ PIN or fingerprint confirmation
- ☐ A success screen with a receipt that can be shared
- ☐ **Three failure states:** insufficient funds · wrong or unregistered number · network timeout after the PIN, where the money's status is unknown

Constraints

- Mobile only, 360×800 frame (Android)
- Use Co-op green for primary actions. You don't need the real logo.
- Meet WCAG AA contrast, with tap targets of at least 44 px
- Transfer limit is KES 150,000 per transaction

What to deliver

1. A user flow diagram showing all steps and branches
2. Low-fi sketches of the key screens (photo or quick frames)
3. **5–8 high-fi screens**, including at least 2 of the failure states
4. Short notes on the canvas explaining your key decisions
5. A 5-minute presentation: the problem, your solution, edge cases, and how you'd measure success

Timer plan

Clock	Step
0:00–0:10	Restate the problem, list your assumptions, and set a success metric
0:10–0:22	User flow with all branches
0:22–0:35	Paper sketches, then pick one direction
0:35–1:15	High-fi screens
1:15–1:30	Annotate, tidy up, and rehearse your 5-minute talk

Stretch goals (only if you have time left)

- A Swahili version of the confirmation screen
- A "Save this recipient" prompt after a successful send
- How the same flow would work on USSD (*667#)

How you'll be assessed

- **Problem understanding:** did you tackle the drop-off and the three complaints directly?
- **Flow logic:** is the path clear, with every branch accounted for?
- **Edge cases:** are the failure states honest, calm and actionable?
- **Visual consistency:** are spacing, type and components applied consistently?
- **Accessibility:** contrast, tap targets, and labels that don't rely on colour alone
- **Communication:** can you explain why you made each decision?

Notes

Problem statement · Assumptions · Success metric

Practice material for the Co-operative Bank of Kenya UI/UX Designer practical assessment (Thu 5 Nov 2026, 14:00). The scenario and figures are made up for practice.
